Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives &
Outlines

Type Casting
Upcast & Downcast

Cast Operators
`const_cast`

Module Summary

Module 32: Programming in C++

Type Casting & Cast Operators: Part 1

Instructors: Abir Das and Sourangshu Bhattacharya

Department of Computer Science and Engineering
Indian Institute of Technology, Kharagpur

`{abir, sourangshu}@cse.iitkgp.ac.in`

Slides taken from NPTEL course on Programming in Modern C++

by **Prof. Partha Pratim Das**

Module Recap

Module 32

Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives &
Outlines

Type Casting
Upcast & Downcast

Cast Operators
`const_cast`

Module Summary

- Leveraging an innovative solution to the Salary Processing Application in C using function pointers, we compare C and C++ solutions to the problem
- The new C solution with function pointers is used to explain the mechanism for dynamic binding (polymorphic dispatch) based on **virtual** function tables

Module Objectives

Module 32

Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives & Outlines

Type Casting

Upcast & Downcast

Cast Operators

`const_cast`

Module Summary

- Understand casting in C and C++
- Understand `const_cast` operator

Module Outline

Module 32

Instructors: Abir
Das and
Sourangshu
Bhattacharya

Objectives &
Outlines

Type Casting
Upcast & Downcast

Cast Operators
`const_cast`

Module Summary

- 1 Type Casting
 - Upcast & Downcast
- 2 Cast Operators
 - `const_cast`

Type Casting

Upcast & Downcast

Cast Operators
const_cast

Module Summary

- Why type casting?
 - Type casts are used to convert the type of an object, expression, function argument, or return value to that of another type
 - (Silent) Implicit conversions
 - The standard C++ conversions and user-defined conversions
 - Explicit conversions
 - Often the type needed for an expression that cannot be obtained through an implicit conversion. There may be more than one standard conversion that may create an ambiguous situation or there may be disallowed conversion. We need explicit conversion in such cases
 - To perform a type cast, the compiler
 - Allocates temporary storage
 - Initializes temporary with value being cast
- ```
double f (int i,int j) { return (double) i / j; }
```

// compiler generates

```
double f (int i, int j) {
 double temp_i = i; // Explicit conversion by (double) in temporary
 double temp_j = j; // Implicit conversion in temporary to support mixed mode
 return temp_i / temp_j;
}
```

# Casting: C-Style: RECAP (Module 26)

Module 32

Type Casting

Upcast & Downcast

Cast Operators

const\_cast

Module Summary

- Various type castings are possible between built-in types

```
int i = 3;
double d = 2.5;
```

```
double result = d / i; // i is cast to double and used
```

- Casting rules are defined between numerical types, between numerical types and pointers, and between pointers to different numerical types and `void`
- Casting can be **implicit** or **explicit**

```
int i = 3;
double d = 2.5, *p = &d;
```

```
d = i; // implicit: int to double
i = d; // implicit: warning: '=' : conversion from 'double' to 'int': possible loss of data
```

```
d = (double)i; // explicit: int to double
i = (int)d; // explicit: double to int
```

```
i = p; // error: '=' : cannot convert from 'double *' to 'int'
i = (int)p; // explicit: double * to int
```

# Casting: C-Style: RECAP (Module 26)

- (**Implicit**) Casting between *unrelated classes is not permitted*

```
class A { int i; };
class B { double d; };
```

```
A a;
B b;
```

```
A *p = &a;
B *q = &b;
```

```
a = b; // error: binary '=' : no operator which takes a right-hand operand of type 'B'
a = (A)b; // error: 'type cast' : cannot convert from 'B' to 'A'
```

```
b = a; // error: binary '=' : no operator which takes a right-hand operand of type 'A'
b = (B)a; // error: 'type cast' : cannot convert from 'A' to 'B'
```

```
p = q; // error: '=' : cannot convert from 'B *' to 'A *'
q = p; // error: '=' : cannot convert from 'A *' to 'B *'
```

```
p = (A*)&b; // explicit on pointer: type cast is okay for the compiler
q = (B*)&a; // explicit on pointer: type cast is okay for the compiler
```

# Casting: C-Style: RECAP (Module 26)

- **Forced** Casting between *unrelated classes is dangerous*

```
class A { public: int i; };
class B { public: double d; };
```

```
A a;
B b;
```

```
a.i = 5;
b.d = 7.2;
```

```
A *p = &a;
B *q = &b;
```

```
cout << p->i << endl; // prints 5
cout << q->d << endl; // prints 7.2
```

```
p = (A*)&b; // Forced casting on pointer: Dangerous
q = (B*)&a; // Forced casting on pointer: Dangerous
```

```
cout << p->i << endl; // prints -858993459: GARBAGE
cout << q->d << endl; // prints -9.25596e+061: GARBAGE
```

# Casting on a Hierarchy: C-Style: RECAP (Module 26)

- Casting on a **hierarchy** is *permitted in a limited sense*

```
class A { };
class B : public A { };
```

```
A *pa = 0;
B *pb = 0;
void *pv = 0;
```

```
pa = pb; // UPCAST: Okay
```

```
pb = pa; // DOWNCAST: error: '=' : cannot convert from 'A *' to 'B *'
```

```
pv = pa; // Okay, but lose the type for A * to void *
```

```
pv = pb; // Okay, but lose the type for B * to void *
```

```
pa = pv; // error: '=' : cannot convert from 'void *' to 'A *'
```

```
pb = pv; // error: '=' : cannot convert from 'void *' to 'B *'
```

# Casting on a Hierarchy: C-Style: RECAP (Module 26)

- **Up-Casting** is *safe*

```
class A { public: int dataA_; };
class B : public A { public: int dataB_; };
```

```
A a;
B b;
```

```
a.dataA_ = 2;
b.dataA_ = 3;
b.dataB_ = 5;
```

```
A *pa = &a;
B *pb = &b;
```

```
cout << pa->dataA_ << endl; // prints 2
cout << pb->dataA_ << " " << pb->dataB_ << endl; // prints 3 5
```

```
pa = &b;
```

```
cout << pa->dataA_ << endl; // prints 3
cout << pa->dataB_ << endl; // error: 'dataB_' : is not a member of 'A'
```

Bhattacharya

Objectives &  
Outlines

Type Casting  
Upcast & Downcast

Cast Operators  
`const_cast`

Module Summary

- Casting in C
  - Implicit cast
  - Explicit C-Style cast
  - Loses type information in several contexts
  - Lacks clarity of semantics
- Casting in C++
  - Performs fresh inference of types without change of value
  - Performs fresh inference of types with change of value
    - ▷ Using implicit computation
    - ▷ Using explicit (user-defined) computation
  - Preserves type information in all contexts
  - Provides clear semantics through cast operators:
    - ▷ `const_cast`
    - ▷ `static_cast`
    - ▷ `reinterpret_cast`
    - ▷ `dynamic_cast`
  - Cast operators can be `grep`-ed (searched by cast operator name) in source
  - C-Style cast must be avoided in C++

# Cast Operators

## Module 32

Das and  
Sourangshu  
Bhattacharya

Objectives &  
Outlines

Type Casting  
Upcast & Downcast

**Cast Operators**  
`const_cast`

Module Summary

- A **cast operator** takes an expression of **source type** (*implicit* from the expression) and converts it to an expression of **target type** (*explicit* in the operator) following the **semantics of the operator**
- Use of cast operators increases robustness by generating errors in **static** or **dynamic** time

# Cast Operators

Sourangshu  
Bhattacharya

Objectives &  
Outlines

Type Casting

Upcast & Downcast

Cast Operators

const\_cast

Module Summary

- **const\_cast** operator: `const_cast<type>(expr)`
  - Explicitly *overrides const and/or volatile* in a cast
  - Usually *does not perform computation or change value*
- **static\_cast** operator: `static_cast<type>(expr)`
  - Performs a *non-polymorphic cast*
  - Usually *performs computation to change value* – **implicit** or **user-defined**
- **reinterpret\_cast** operator: `reinterpret_cast<type>(expr)`
  - Casts between *unrelated pointer types* or *pointer and integer*
  - *Does not perform computation yet reinterprets value*
- **dynamic\_cast** operator: `dynamic_cast<type>(expr)`
  - Performs a *run-time cast* that verifies the validity of the cast
  - *Performs pre-defined computation*, sets **null** or **throws exception**

# const\_cast Operator

## Module 32

Instructors: Abir  
Das and  
Sourangshu  
Bhattacharya

Objectives &  
Outlines

Type Casting  
Upcast & Downcast

Cast Operators  
**const\_cast**

Module Summary

- **const\_cast** converts between types with different cv-qualification
- Only **const\_cast** may be used to cast away (remove) const-ness or volatility
- Usually **does not perform computation or change value**

# const\_cast Operator

Module 32

Objectives &  
Outlines

Type Casting  
Upcast & Downcast

Cast Operators  
const\_cast

Module Summary

```
#include <iostream>
using namespace std;

class A { int i_;
public: A(int i) : i_(i) { }
 int get() const { return i_; }
 void set(int j) { i_ = j; }
};

void print(char * str) { cout << str; }

int main() {
 const char * c = "sample text";
 // print(c); // error: 'void print(char *)': cannot convert argument 1 from 'const char *' to 'char *'

 print(const_cast<char *>(c)); // Okay

 const A a(1);
 a.get();

 // a.set(5); // error: 'void A::set(int)': cannot convert 'this' pointer from 'const A' to 'A &'

 const_cast<A&>(a).set(5); // Okay

 // const_cast<A>(a).set(5); // error: 'const_cast': cannot convert from 'const A' to 'A'
}
```

# const\_cast Operator vis-a-vis C-Style Cast

Module 32

Instructors: Abir

Bhattacharya

Objectives &  
Outlines

Type Casting  
Upcast & Downcast

Cast Operators  
const\_cast

Module Summary

```
#include <iostream>
using namespace std;

class A { int i_;
public: A(int i) : i_(i) { }
 int get() const { return i_; }
 void set(int j) { i_ = j; }
};

void print(char * str) { cout << str; }

int main() {
 const char * c = "sample text";

 // print(const_cast<char *>(c));
 print((char *) (c)); // C-Style Cast

 const A a(1);

 // const_cast<A&>(a).set(5);
 ((A&)a).set(5); // C-Style Cast

 // const_cast<A>(a).set(5); // error: 'const_cast': cannot convert from 'const A' to 'A'
 ((A)a).set(5); // C-Style Cast
}
```

# const\_cast Operator

```

#include <iostream>
struct type { type(): i(3) { }
 void m1(int v) const {
 //this->i = v; // error C3490: 'i' cannot be modified -- accessed through a const object
 const_cast<type*>(this)->i = v; // Okay as long as the type object isn't const
 }
 int i;
};

int main() { int i = 3; // i is not declared const
 const int& cref_i = i; const_cast<int&>(cref_i) = 4; // Okay: modifies i
 std::cout << "i = " << i << '\n';

 type t; // note, if this is const type t;, then t.m1(4); may be undefined behavior
 t.m1(4);
 std::cout << "type::i = " << t.i << '\n';

 const int j = 3; // j is declared const
 int* pj = const_cast<int*>(&j); *pj = 4; // undefined behavior! Value of j and *pj may differ
 std::cout << j << " " << *pj << std::endl;

 void (type::*mfp)(int) const = &type::m1; // pointer to member function
 //const_cast<void(type::*)(int)>(mfp); // error C2440: 'const_cast': cannot convert from
 // 'void (__thiscall type::*)(int) const' to
 // 'void (__thiscall type::*)(int)' const_cast does not work
 // on function pointers
}

```

Output:  
i = 4  
type::i = 4  
3 4
